MAIL DATE

DELIVERY MODE

12/03/2010

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/552,103	Applicant(s) KIEFER ET AL.	
	Examiner QUEENIE DEGHAN	Art Unit 1741	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 27 September 2010.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-10, 12-29, 32, 33 and 50 is/are pending in the application.
- 4a) Of the above claim(s) 20, 22-24, 27 and 33 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-10, 12-19, 21, 25-26, 28, -29, 32, 50 is/are rejected.
- 7) ☒ Claim(s) 1, 15 is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 112

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 2-4, 16, 25-27, and 29 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
3. Claims 2, 3 and 4 merely recite mathematical equations without reciting any positive step. It is unclear what method steps are actually required.
4. Claim 16 recite introducing molten material into a crucible. It is unclear if the molten material is the same as the melt as recited in claim 13, which claim 16 depends on, or if it is a different material. If the molten material is the same as the melt of claim 13, it is unclear how the separate apparatus (the crucible) relates to the process of claims 1 and 13. If the molten material is different from the melt, then what is relationship between the melting unit of claim 1 and the crucible of claim 16. Due to the indefiniteness of the claim, claim 16 cannot be examined.
5. Claims 25-27 depend on claim 24, which has been withdrawn. The limitations of these claims are unclear and cannot be examined.

Claim Objections

6. Claim 1 is objected to because of the following informalities: It appears the word "materials" in line 1 was inadvertently deleted in the amendment. Appropriate correction is required.

7. Claim 15 is objected to because of the following informalities: There is a superscripted "3" that does not belong.

Claim Rejections - 35 USC § 103

8. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

9. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

10. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Art Unit: 1741

11. Claims 1-6, 8, 18-19, 25, 29, 32, and 50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zumbrunnen (4,133,969). Zumbrunnen discloses a method for melting inorganic materials comprising introducing the inorganic materials into melting crucible with cooled walls for producing a skull layer of the melt on the cooled walls (col. 3 lines 30-33, 39-46), selecting a temperature of a melt in the skull crucible at a temperature, wherein the energy required is minimized and thereby providing the most efficient energy utilization (col. 9 line 66 to col. 10 line 19). Zumbrunnen also teaches determining the removal of the melt and the addition of inorganic material based on the energy supplied (col. 12 lines 11-16, col. 4 lines 45-54). In other words, Zumbrunnen selects the throughput to maintain a desired melt level. Although residence time is not specifically mentioned, one skilled in the art would understand that the energy supplied to the melting of the inorganic materials is linked to the residence time required for melting the materials (a melt-down time). Therefore, in setting the energy supplied and maintaining a desired melt level, the residence time is also selected. It would have been obvious to one of ordinary skill in the art at the time of the invention to have expected Zumbrunnen to have adapted the throughput to a required residence time, since the final goal is to achieve a melt and Zumbrunnen teaches the importance of maintaining a melt level within the crucible.

12. Regarding claims 2-4 and 29, Zumbrunnen teaches closely controlling the melt temperature and the heat transfer through the skull to minimize the energy required to operate the apparatus and providing for most efficient energy utilization. Claims 2-4 and 29 recite mathematical formulas that the energy needed to heat the inorganic

Art Unit: 1741

material is based on commonly known variables, such as the heat capacity of the melt, volume of the melt, density of the melt and residence time for the melt. These variables merely define the minimal energy require to achieve a melt in the skull crucible. Putting in any more energy than what is needed to satisfy the bare minimal heating requirement would simply be energy lost to the environment. Therefore, it would have been obvious to one of ordinary skill in the art to expect the equations of claims 2-4 and the limitation of claim 29 to naturally be satisfied since minimizing energy consumption is recognized as a goal of Zumbrunnen.

13. Regarding claims 5 and 25, Zumbrunnen discloses feeding thermal energy directly to the melt by direct inductive heating (abstract, col. 2 lines 59-65).

14. Regarding claims 6 and 8, Zumbrunnen teaches additionally mixing the melt by generating a convective flow in the melt (col. 11 lines 52-58).

15. Regarding claim 18, Zumbrunnen discloses continuous feeding and removing of the inorganic materials to and from the melt (col. 11 lines 65-68).

16. Claims 6-7, 10-12, and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zumbrunnen as applied to claim 1 above, in view of Gagel et al. (5, 738,811). Regarding claims 6-7, Zumbrunnen does not mention a bubbler. Gagel teaches a process for melting inorganic materials in a skull crucible comprising of additionally mixing the melt by agitating the melt with bubbling so as to reduce temperature and composition variation within the melt (col. 3 lines 12-28, figure 3). It would have been obvious to one of ordinary skill in the art at the time of the invention to

Art Unit: 1741

have utilized the bubbling action of the Gagel in the process of Zumbrunnen in order to promote uniform temperature and composition in the melt further.

17. Regarding claims 10-12, Zumbrunnen teaches supplying the inorganic materials into the melt (col. 11 lines 66-68). Zumbrunnen also teaches the melt can be poured from the skull for casting (col. 12 lines 1-5), which implies a batch process. Gagel teaches a similar process of charging the crucible with a batch of inorganic material in powder form, which is considered small pellets, pouring out the batch and repeating by adding more inorganic materials to the surface of the melt (col. 7 lines 44-50, col. 8 lines 52-61). It would have been obvious to one of ordinary skill in the art at the time of the invention to have expected the suggested batch process of Zumbrunnen to comprise of similar steps of adding inorganic materials in the form of a batch and placing the material onto the surface of the melt, as it is a well known process for producing a molten batch for casting purposes, as suggested by Gagel.

18. Regarding claim 26, Zumbrunnen teaches feeding thermal energy directly to the melt, but does not specify direct conductive heating. Gagel teaches a well known method for heating a melt by utilizing electrodes which provide for direct conductive heating (col. 1 lines 25-30). It would have been obvious to one of ordinary skill in the art at the time of the invention to have utilized direct conductive heating as an alternative to the thermal heating of Zumbrunnen as a known means for successfully heating and melting the inorganic materials of Zumbrunnen.

19. Claims 13-14 and 16-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zumbrunnen as applied to claim 1 above, and further in view of

Art Unit: 1741

Rodek et al. (WO 0216274 as represented by 7,694,533). Zumbrunnen does not discuss a refining step. Rodek teaches a refining is a necessary step after melting in order to remove residual bubbles from the melt, wherein refining can be performed by adding a refining agent (col. 1 lines 11-15). Rodek also discloses introducing the melt/inorganic material into the crucible from one side of the crucible at a melt bath surface and discharging the melt on an opposite side at the melt batch surface (fig. 1, claim 1). Such a flow pattern allows for less wear and tear on a connecting channel between the melting crucible and refining crucible. It would have been obvious to one of ordinary skill in the art at the time of the invention to have utilized the flow pattern in the melting crucible as Rodek and a refining step in the process of Zumbrunnen in order to assist in the removal of residual bubbles for the production of a high quality inorganic product, while minimizing wear and tear on the apparatus.

20. Regarding claim 14, Zumbrunnen teaches producing a convective flow in the melt (col. 11 lines 52-58).

21. Claim 26 is rejected under 35 U.S.C. 103(a) as being unpatentable over Zumbrunnen, as applied to claim 25 above, in view of Gagel et al. (.

22. Claims 8-9, 14-15, 21, and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zumbrunnen, as applied to claims 6 and 19 above, and Rodek, as applied to claim 13 above, in future view of Romer et al. (WO 01/14266 as represented by 7,137,277). Regarding claims 8-9 and 14-15, Zumbrunnen does not disclose a specific temperature difference in the melt for producing a convective flow. Romer teaches a similar process of melting inorganic materials and refining the melt, wherein a

Art Unit: 1741

convective flow is produced by setting a viscosity of less than 10^2 dPas and a melt temperature difference between an inner region of the melt and an outer region of the melt of greater than 250 K (col. 1 lines 52-67, col. 2 lines 1-10). It would have been obvious to one of ordinary skill in the art at the time of the invention to have employed the set the viscosity to less than 10^2 dPas and the temperature difference in the skull crucible greater than 250K in the process of Zumbrennen in order to allow for more effective thorough mixing of the melt, as suggested by Romer.

23. Regarding claim 21, as mentioned above, Zumbrennen teaches selecting a T_{eff} , but does not disclose a specific viscosity or temperature difference of the melt. Romer teaches a similar process of melting inorganic material and refining the melt. Romer further teaches thorough mixing of the melt can be achieved with an optimal viscosity of less than 10^3 dPas. Romer also teaches a temperature difference in the melt between an inner region of the melt and an outer region of the melt of greater than 150K allows for stronger and more effective thorough mixing as well (col. 1 line 52 to col. 2 line 10). It would have been obvious to one of ordinary skill in the art at the time of the invention to taken into consideration the optimal viscosity of the melt and temperature difference in the melt for convective mixing of the melt when determining the T_{eff} temperature of the Zumbrennen, in order to provide for optimal conditions for the thorough mixing of the melt within a skull crucible, while minimizing energy consumption.

24. Regarding claim 28, Romer further teaches the optimal viscosity for thorough mixing of the melt can be achieved by providing for temperatures of over 1700°C, especially for some high melting point inorganic materials (col. 2 lines 1-10). It would

Art Unit: 1741

have been obvious to one of ordinary skill in the art at the time of the invention to have utilized a temperature of over 1700°C in the process of Zumbrunnen so as to provide for the optimal viscosity for thorough mixing of the melt.

Response to Arguments

25. Applicant's arguments with respect to Jeanvoine have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

26. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to **QUEENIE DEGHAN** whose telephone number is

Art Unit: 1741

(571)272-8209. The examiner can normally be reached on Monday through Friday
8:30am - 5:00pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew Daniels can be reached on 571-272-2450. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

/Queenie Dehghan/
Examiner, Art Unit 1791
